

First, let's import the necessary libraries: `pandas` for data manipulation, and `matplotlib.pyplot` and `seaborn` for plotting.

```
1 import pandas as pd
2 import matplotlib.pyplot as plt
3 import seaborn as sns
```

Now, let's load a sample CSV file into a pandas DataFrame. I'll use [/content/ica_5.csv](#).

```
1 df = pd.read_csv('/content/ica_5.csv')
2 df.columns = df.columns.str.strip() # Clean column names
3 display(df.head())
```

	x	y
0	1662.223602	80.277779
1	2247.625925	80.277779
2	2762.990652	80.277779
3	3562.247890	80.138889
4	3562.247890	80.138889

Finally, let's create a scatter plot to visualize the relationship between `housing_median_age` and `median_house_value`.

```
1 plt.figure(figsize=(10, 6))
2 # The columns were cleaned in the previous cell, so they should now be 'x' and 'y'
3 sns.scatterplot(x='x', y='y', data=df) # Changed back to scatterplot
4 plt.xscale('log') # Set x-axis to logarithmic scale
5 plt.title('Scatter Plot of x vs. y (log scale for x) from ica_5.csv') # Update title
6 plt.xlabel('x (log scale)') # Update x-axis label
7 plt.ylabel('y')
8 plt.grid(True)
9 plt.show()
```
